

18.2 Esters

Name: _____ Class: _____ Date: _____

Total: 11 marks

KEY WORDS hydrolysis 水解 • condensation 缩合 • esters 酯 • esterification 酯化 • alcohol 醇

Objective

Build the skills to answer exam questions on **esters** 酯 — their formation by **esterification** 酯化 and their **hydrolysis** 水解.

You must be able to:

- recall how esters are made (condensation of an alcohol and a carboxylic acid)
- describe the hydrolysis of esters by dilute acid and by dilute alkali

1 Worked examples

■ Making esters

the $-\text{OH}$ (acid) and $-\text{H}$ (alcohol) leave as **water**; the $\text{C}-\text{O}-\text{C}$ ester link forms
(concentrated H_2SO_4 catalyst; reversible)

*Esterification is a reversible **condensation**: alcohol + carboxylic acid (conc. H_2SO_4 catalyst) $\rightarrow$ ester + water*

■ Hydrolysis of esters

Dilute acid (reversible): carboxylic acid + alcohol. Dilute alkali (not reversible): the carboxylate salt + alcohol

2 Practice

2.1 State the reagents and catalyst needed to make an ester from an alcohol and a carboxylic acid. [2]

2.2 Name the small molecule lost when an ester is formed. [1]

3 Exam-style questions

3.1 The type of reaction by which an ester is formed from an alcohol and a carboxylic acid is: [1]

- **A** addition
- **B** condensation
- **C** elimination
- **D** free-radical substitution

3.2 Hydrolysis of an ester with dilute **alkali** gives an alcohol and: [1]

- **A** the carboxylic acid
- **B** the salt of the carboxylic acid (carboxylate)
- **C** carbon dioxide
- **D** an aldehyde

3.3 (a) Write the equation for the formation of ethyl ethanoate from ethanol and ethanoic acid. [2]

(b) State the products of the hydrolysis of ethyl ethanoate by dilute sulfuric acid. [2]

3.4 Explain why hydrolysis with dilute alkali is **not** reversible, but hydrolysis with dilute acid is. [2]

Solutions

2.1 an alcohol and a carboxylic acid; concentrated sulfuric acid catalyst.

2.2 water.

3.1 B. Esterification is a condensation reaction.

3.2 B. Alkaline hydrolysis gives the carboxylate salt (plus the alcohol).

3.3 (a) $\text{CH}_3\text{COOH} + \text{C}_2\text{H}_5\text{OH} \rightleftharpoons \text{CH}_3\text{COOC}_2\text{H}_5 + \text{H}_2\text{O}$.

(b) ethanoic acid and ethanol.

3.4 with alkali the carboxylic acid is converted to its carboxylate salt, which does not react back, so the reaction goes to completion; with acid the products are the acid and alcohol, which can re-esterify, so it is reversible.
