

25 Conjugate acids and bases – Part 1

Name: _____ Class: _____ Date: _____

Vocabulary 词汇

Write each word three times. 把每个单词抄写三遍。

English	中文	Write it 3 times (English)
conjugate base	共轭碱	_____
conjugate acid	共轭酸	_____
conjugate acid–base pair	共轭酸碱对	_____

Recall

A Brønsted acid donates an H^+ (a proton); a base accepts one. This links acids and bases in pairs.

New ideas

Read these first, then do the Practice.

■ 1 Conjugate pairs

When an acid loses H^+ , what is left is its **conjugate base** 共轭碱. When a base gains H^+ , it becomes its **conjugate acid** 共轭酸. The two form a **conjugate acid–base pair** 共轭酸碱对, differing by one H^+ .

■ 2 The pH scale

pH measures acidity: $\text{pH} = -\log[\text{H}^+]$. A low pH is acidic, 7 is neutral, a high pH is alkaline.

Worked example. A solution with $[\text{H}^+] = 1.0 \times 10^{-3} \text{ mol dm}^{-3}$ has $\text{pH} = -\log(1.0 \times 10^{-3}) = 3$.

Watch out: a conjugate pair differs by exactly *one* H^+ . A strong acid has a *weak* conjugate base — e.g. HCl (strong acid) gives Cl^- , which barely accepts a proton back.

Practice

Try these in order.

25.1 What is left when an acid loses H^+ ? [1]

25.2 What does a base become when it gains H^+ ? [1]

25.3 By how much do a *conjugate pair* differ? [1]

25.4 Write the formula for pH. [1]

25.5 What pH is neutral? [1]

25.6 Challenge. In the reaction $\text{NH}_3 + \text{H}_2\text{O} \rightleftharpoons \text{NH}_4^+ + \text{OH}^-$, identify the conjugate acid–base pair that contains nitrogen. [2]
