

# 18.1 Photosynthesis and limiting factors

Name: \_\_\_\_\_ Class: \_\_\_\_\_ Date: \_\_\_\_\_

Total: 10 marks

**KEY WORDS** photosynthesis • limiting factor

## Objective

Photosynthesis and limiting factors. Supported SL concept preparation; original classroom practice, not an official IB paper or assessed learner work.

## 1 Key knowledge and worked examples

### ■ What would explain this observation?

- A brighter lamp does not always produce more oxygen from pondweed. Another factor may limit the process when light is already sufficient.
- Start with a prediction. State the quantities or features you would compare, then decide what evidence could distinguish two explanations.

### ■ Build the model

- **Photosynthesis** transfers energy from light into chemical stores. Carbon dioxide and water form carbohydrate, releasing oxygen. Chlorophyll absorbs light; light intensity, temperature and carbon dioxide supply can affect rate.
- **limiting factor** : A factor whose shortage restricts rate; photosynthesis: Light-driven formation of carbohydrate.

### ■ Choose evidence that can test it

- Change only one factor when testing a limiting factor. At low light, extra light may increase rate. At a plateau, the changed factor is no longer the main limit in that range; the graph alone does not identify which other factor is limiting.
- Measure collected gas volume over a fixed time instead of assuming all bubbles have the same volume. Control temperature, plant size and carbon dioxide supply. Allow the plant to adjust before each reading and repeat.

### ■ Work from known quantities

- State the known values and their units. Choose the relation because its assumptions fit this case, then rearrange before substitution.
- Known: 6.0 cubic centimetres of gas are collected in 3.0 minutes. Use rate = volume/time. Rate =  $6.0/3.0 = 2.0$  cubic centimetres per minute. Bubble counts can be a rough proxy, but bubbles of different size make comparisons less reliable.

### Example:

9.0 cubic centimetres of gas are collected in 3.0 minutes. Find the rate. Use the same sequence: known quantities → model → relation → substitution → unit and interpretation.

### ■ Check the conclusion and its limits

- Moving a lamp changes light and may also change temperature. A photosynthesis experiment needs control of heating, not just a ruler.
- Return to the original observation. Explain what the result supports, which conditions it assumes, and one way to test a competing explanation.

### Warn:

All oxygen bubbles have exactly the same volume. This claim is false: Moving a lamp changes light and may also change temperature. A photosynthesis experiment needs control of heating, not just a ruler.

### Key:

Photosynthesis and limiting factors: Change only one factor when testing a limiting factor. At low light, extra light may increase rate. At a plateau, the changed factor is no longer the main limit in that range; the graph alone does not identify which other factor is limiting.

## 2 Practice

**2.1** A rate-light graph reaches a plateau. What follows? Choose one answer.

- **A** Light is still certainly the only limit
- **B** Another factor may now limit the rate
- **C** Photosynthesis has stopped

[1]

**2.2** 9.0 cubic centimetres of gas are collected in 3.0 minutes. Find the rate. Show the relation, substitution and units.

[2]

**2.3** Decide whether this claim is true and justify: All oxygen bubbles have exactly the same volume.

[2]

**2.4** A factor whose shortage restricts rate: write the technical term.

[1]

## 3 Exam-style questions

**3.1** A fictional plant produces  $8 \text{ cm}^3$  in 4 min at low light and  $12 \text{ cm}^3$  in 4 min at high light. Explain the change, and why an unchanged rate after a further light increase would not identify the next limiting factor.

[4]

## Solutions

---

**2.1 B** Change only one factor when testing a limiting factor. At low light, extra light may increase rate. At a plateau, the changed factor is no longer the main limit in that range; the graph alone does not identify which other factor is limiting.

**2.2**  $\text{rate} = 9.0 / 3.0 = 3.0 \text{ cm}^3/\text{min}$ .

**2.3** False. Moving a lamp changes light and may also change temperature. A photosynthesis experiment needs control of heating, not just a ruler.

**2.4** limiting factor. limiting factor means A factor whose shortage restricts rate.

**3.1** Rates 2 and 3  $\text{cm}^3/\text{min}$ , a 50% increase. A plateau suggests another limitation under those conditions, but does not identify it. Control temperature and carbon dioxide, allow equilibration and repeat.
